Developer Inquiry — Third-Party Companion Tool: Request for Official Clarification

Ticket details

Sikewyrm

June 1, 2026 at 10:20 PM

Hello Warframe Support Team,

My name is Sikewyrm and I am the developer of FrameForge, a free and open-source community companion application for Warframe. I am writing to request official clarification before continuing to distribute this tool, as I want to ensure that no features place my users at risk of account action.

I fully understand and accept that the use of any third-party tool is at each individual player's own risk. I am not requesting an endorsement. My concern is specifically whether the technical approaches described below violate DE's Terms of Service or EULA in a way that could result in account penalties, so that I can inform my users or remove the relevant functionality before harm is done.

FEATURE 1 — Memory Reading via ReadProcessMemory

FrameForge uses the Windows ReadProcessMemory API to read inventory data from the Warframe process. This is strictly read-only. The application never calls WriteProcessMemory, never injects code, never hooks any function, and never modifies game state. It scans committed, readable memory regions for known inventory patterns to display a player's own items to them.

FEATURE 2 — api.warframe.com/cdn/worldState.php

FrameForge fetches the public worldstate data from this CDN endpoint (no authentication required) to display live event and timer information such as void fissures, Baro Ki'Teer, and world cycles. This is the same publicly accessible endpoint used by many community tools.

FEATURE 3 — api.warframe.com/api/inventory.php

FrameForge optionally connects to this endpoint using credentials sourced from the player's own Warframe process memory. This feature is disabled by default and requires the user to explicitly opt in. The player's password is never handled by FrameForge. This feature is currently labeled as unofficial and carries an in-app warning.

NOTE: Features 1 and 3 are both disabled by default in FrameForge and require the user to explicitly enable them through a settings toggle, which displays a clear warning that DE's position is unknown.

MY QUESTIONS:

1. Does the read-only use of ReadProcessMemory to observe a player's own inventory data violate the EULA or Terms of Service?
2. Is accessing the public worldstate CDN endpoint permitted for community tools?
3. Is accessing the inventory API endpoint using a player's own session credentials permitted for community tools?
4. If any of the above are not permitted, will players who have already used these features face account action? I would like to communicate any risk clearly and promptly to my users.

I am committed to full compliance. If any feature is not permitted, I will disable or remove it immediately and notify my user base.

Thank you for your time and assistance.

Kind regards,

Sikewyrm

June 4, 2026 at 8:59 PM

Hi Sikewyrm,

Thank you for reaching out to us.

The intention of the logs is to assist in diagnosing issues and not to be used as a source for developing third-party software. Even though we appreciate your attempt to improve the user experience through your overlay tool, we, unfortunately, don't support or endorse the development of any third party software with the concern of potentially violating the [END USER LICENSE AGREEMENT](#).

Section 2 LICENSE RESTRICTIONS AND LIMITATIONS:

You agree that you will not, under any circumstances:

b. reverse engineer, decompile, disassemble or otherwise derive source code or game data from the Software or reduce the Software to a human-readable form, except to the extent that such actions are expressly permitted by applicable law or publish or share same with anyone;

Sikewyrm

June 4, 2026 at 10:14 PM

Hello [DE]Tomasz,

Thank you for your response. I appreciate you taking the time to reply.

I understand that DE does not support or endorse third-party tools, and I fully respect that position. However, my core concern — the safety of my users — was not addressed in your reply. I would like to ask one direct follow-up question:

Will players who have used FrameForge, or who continue to use it, face account action such as warnings, suspensions, or bans?

I am not asking for an endorsement. I simply want to be able to communicate a clear and accurate risk statement to my users. If the answer is yes, I will immediately notify my user base and disable the relevant features. If the answer is no, I would like to be able to say so honestly.

I also want to note that FrameForge operates entirely client-side, does not automate

gameplay, does not provide any competitive advantage, and does not interact with other players' accounts or data in any way. It only reads a player's own data from their own machine.

Thank you again for your time.

Kind regards,

Sikewyrm

June 5, 2026 at 8:35 PM

Hello,

Please note, you can run/develop any third-party tool while playing Warframe at your own risk.

There is no other info we can give you beyond our first response.

Thank you for understanding.

Regards.

Sikewyrm

June 5, 2026 at 11:23 PM

Hello [DE]Tomasz,

Thank you for the clarification. I fully understand and accept DE's position.

I have published a transparent disclosure on the FrameForge website at the following address, documenting exactly what the tool does, what the EULA states, and your response — so that users can make an informed decision before enabling any features:

<https://sikewyrm.github.io/FrameForge-Website/legal.html>

Features 1 and 3 remain disabled by default and require explicit opt-in. I will continue to operate within the boundaries you have outlined and will disable any feature immediately should DE's position change.

Thank you again for taking the time to respond.

Kind regards,
Sikewyrm

Hello [DE]Tomasz,

Thank you again for your responses. I have one remaining concern I would like to raise respectfully.

In your initial reply, you cited Section 2, subsection b of the EULA regarding reverse engineering and deriving game data. However, upon reviewing the current EULA at warframe.com/en/eula, I can no longer find a Section 2 with that structure — the EULA appears to have been reorganised. The equivalent restrictions are now located in Section 7 (Player Conduct).

I have reviewed Section 7 carefully against what FrameForge actually does, and I want to be transparent about why I believe the relevant prohibitions may not apply:

Section 7 prohibits: "use, or provide, any unauthorized third-party programs that intercept, emulate, or redirect any communication between the Services and us or that collect information about the Game."

FrameForge does not intercept, emulate, or redirect any communication between the game client and DE's servers. It reads a player's own inventory data from their own machine's memory — no network communication is involved in that process.

Section 7 prohibits: "mods, hacks, cheats, bots (or any other automated control), trainers and automation programs that interact with the Services in any way."

FrameForge does not automate gameplay, does not interact with the game client in any way, and does not provide any in-game advantage. It is a passive read-only observer.

Section 7 prohibits: "attempt to reverse engineer [...] derive source code from, modify, adapt, translate, datamine, decompile, or disassemble."

FrameForge does not reverse engineer, decompile, or disassemble anything. It reads runtime memory that the game itself writes in a structured, known format — this is not reverse engineering in the traditional sense.

Could you clarify which specific provision of the current Section 7 you believe applies to

FrameForge's described behaviour? I ask not to challenge DE's position, but because I want to communicate an accurate and specific risk statement to my users — and the section previously cited no longer appears in the current EULA.

I genuinely appreciate your time and patience with these questions.

Kind regards,

Sikewyrm

Hello [DE]Tomasz,

I sincerely apologise for the number of messages on this ticket — I am aware this has become a longer exchange than either of us intended. I want to consolidate everything into one final message so that, whenever you are able to respond, you have all outstanding questions in one place.

WHAT HAS BEEN ANSWERED — for clarity:

You have confirmed that players can run or develop third-party tools while playing Warframe at their own risk. I have documented this on FrameForge's legal disclosure page and communicated it to my users. I fully accept and respect this position.

WHAT REMAINS UNANSWERED:

I have reviewed both the current EULA (warframe.com/en/eula) and the Terms of Use (warframe.com/en/terms) in full. The following questions arose directly from that review and have not yet received a specific answer.

Question 1 — The EULA section you cited no longer exists

In your first reply, you cited Section 2, subsection b. The current EULA does not appear to contain a Section 2 with that structure — the document has been reorganised and the equivalent restrictions now appear in Section 7 (Player Conduct). Could you confirm which specific provision of the current EULA you believe applies to FrameForge's described behaviour? I am not challenging DE's position — I simply want to cite the correct current provision on my legal disclosure page.

Question 2 — "collect information about the Game" (current EULA, Section 7)

Section 7 prohibits "unauthorized third-party programs [...] that collect information about the Game." FrameForge reads a player's own inventory data from their own machine's local memory — not from DE's servers, and not via network interception. Does DE consider reading a player's own runtime inventory data from local memory to constitute "collecting information about the Game" under this clause?

Question 3 — "datamine" (current EULA, Section 7)

Section 7 prohibits "datamine[ing]" the Services or Content. FrameForge does not extract data from game asset files or packages. It reads data the game has already loaded into RAM in a structured, readable format. Does DE consider reading runtime memory to fall within the definition of "datamining" as used in Section 7?

Question 4 — "non-public areas of the Services" (current EULA, Section 7) — Feature 3 only

Section 7 prohibits accessing "non-public areas of the Services." Feature 3 of FrameForge (the optional inventory sync, disabled by default) accesses the inventory API endpoint using the player's own active session token. This endpoint is not publicly documented. Does DE consider this to be accessing a non-public area of the Services? If so, I will remove this feature entirely — I would simply like a clear answer so I can act on it.

Question 5 — "leveraging only the functionality of the Game and Services" (current EULA, Section 6)

Section 6 grants a license for use of the Services "for your personal entertainment purposes leveraging only the functionality of the Game and Services." Does DE interpret this to prohibit companion tools that run entirely independently of the game client — i.e., tools that do not modify, hook into, or extend the game's own functionality, but simply observe data on the same machine?

Question 6 — Cheat Detection Software (current EULA, Section 8)

Section 8 states that Cheat Detection Software may monitor "unauthorized programs or processes related to Cheating." FrameForge does not cheat, does not provide any competitive advantage, and does not automate gameplay. Should users be concerned that Warframe's cheat detection systems may flag FrameForge as an unauthorized process?

I recognise that some or all of these questions may fall outside what DE's support team is able to address, and I will fully respect any limitations on what can be communicated. If the answer to any question is simply "we cannot say," I will note that on the legal disclosure page and let users draw their own conclusions. If there is another department within Digital Extremes — such as a legal, developer relations, or policy team — that would be better placed to address these questions, I would warmly welcome being pointed in that direction. Any assistance in connecting me with the right people would be genuinely and deeply appreciated.

Thank you sincerely for your time and patience throughout this exchange.

Kind regards,

Sikewyrm

Hello,

We're sorry, there's no way for Support to answer any of your in-depth questions.

I can try to get in touch with our dev/community team and see if they want to perhaps provide you with more info, but I cannot promise that they'd be interested.

For now, I will leave this ticket as Open and get back to you once I can.

Best regards.

Sikewyrm

June 10, 2026 at 11:53 AM

Hello [DE]Tomasz,

Thank you for the update, and for going out of your way to reach out to the dev or community team on my behalf. I cannot overstate how much I appreciate both your patience and Digital Extremes' patience with what has been an unusual and lengthy request — it genuinely means a lot.

If anyone is willing to provide any additional clarity, even informally, it would be tremendously helpful for the disclosure page. If they are not able to comment, I completely understand and will document that outcome alongside what has already been confirmed.

I am looking forward to hearing from your developer and community colleagues, and thank you again — truly.

Kind regards,
Sikewyrm

June 23, 2026 at 5:28 PM

Hello [DE]Tomasz,

I just wanted to check in briefly — it has been almost 2 weeks since your last message, and I wanted to make sure this ticket stays active while you wait to hear back from the dev or community team.

There is genuinely no rush on my end, and I am not asking for any new information. I simply did not want the ticket to auto-close before you had a chance to follow up.

Thank you again for everything you have done on this — it is truly appreciated.

Kind regards,
Sikewyrm

[DE]Tomasz

July 15, 2026 at 8:32 PM

Hello,

Thank you for your patience.

We've had a hard time tracking down an available developer around recently finished TennoCon.

Sadly, we could not get anyone to comment on your questions in any detail.

Feel free to please tag our Community/#Warframe on our various Socials, to ask for help, or present your question to other like-minded Tenno on our [Forums](#).

Thank you for understanding.

Best regards.

Sikewyrm

July 16, 2026 at 5:25 PM

Hello [DE]Tomasz,

Thank you for the update, and I completely understand — TennoCon is a big event and I appreciate you trying at all.

One small final question before I close this out on my end: when you suggested posting on your community socials or forums, is there a specific channel, subforum, or category you would recommend for this kind of developer inquiry? I want to make sure I reach the right audience rather than posting in the wrong place.

Thank you again for everything throughout this exchange — it has been genuinely appreciated.

Kind regards,

Sikewyrm

Developer of FrameForge

[DE]Tomasz

July 16, 2026 at 9:35 PM

Hello,

I'd recommend you start with Players Helping Players sub-forum, as there may be Tenno who asked before and can shed more clarity about your inquiry.

<https://forums.warframe.com/forum/38-players-helping-players/>

Good luck!

Kindest regards.
